

Please note that the first link is only for accessing the BDI-II test, and that the **annotations have to be done on the chat screen.**

Start by providing your Prolific ID on the chat screen. Once you save your Prolific ID, you will be able to chat with the simulated patient. At each point in the conversation, you will be prompted to write a message. After each answer from the patient, you will be asked to choose which symptoms of the BDI-II test you can infer for the patient based on their answer, and you will be asked to provide the score for the selected symptoms. It is possible to move on to the next conversation turn without filling any symptoms during the current turn. Once you are done annotating all 21 symptoms of the test, you can either choose to chat further with the patient to modify some scores, or you can submit the conversation, which will bring you to task completion.

Confidentiality: All collected data will be anonymized through the assignment of an alphanumeric code as the participant ID. No personal data will be asked of the participants at any point in the study, other than the Prolific ID, which will only be used for payment and will not be made publicly available.

Data sharing: The organizers of this study request your permission to analyze the collected data for teaching and research purposes. Your data will be used only in an anonymized form and your identity will never be revealed or used in connection with the data. Data collected from this study will be released as a publicly available, anonymized dataset of conversations between chatbot patients and trained professionals with annotations of scored BDI-II test symptoms at each turn.

Study withdrawal: Your participation in the study is completely voluntary. If, for any reason, you want to withdraw from the study, you can do so at any time by closing the browser windows. You have the right to require data collected prior to your withdrawal to be partially or entirely deleted. To do so, please send us a message through Prolific, specifying if you want all or part of your data to be permanently deleted. Data that are complete (i.e. “Submitted” by the participant after the annotation of 21/21 symptoms), and that are not removed from the database before the 30th June 2026 will be preserved in anonymized format and will be accessible online.

By submitting your conversation with the chatbot via the “Submit & Finish Session” button on the chat interface, you agree to the terms listed above.
